

Eating right, Blood Type B

The following list of foods, is a summary of the excellent work done by Dr D'Adamo, in his latest book "Live Right For Your Type", and includes updated information regarding "secretor Status", an important clinical distinction when it comes to food selection.

Consider the "**Secretor**" (around 80% of people) as a person with their blood type, and thus their immune components, expressed throughout their body fluids, like a well-guarded facility with a security fence and guard dogs, designed for all sorts of possible attacks.

In contrast consider the "**Non-Secretor**" as the more primitive or simplistic immune system, with its components present in the blood. The analogy would be a burglar alarm inside your house, when it goes off you are already in trouble, and the battle for survival may be expensive with the home invasion hard to reverse.

In life we find the non-secretor less able to cope with the modern existence of chemicals, high carbohydrate consumption and man-made bugs and viruses. Chronic fatigue, hypersensitivity to chemicals and foods, and diabetes are more common with non-secretor group.

The following lists, apply to **Secretor only**. To find out your secretor status you will need to order the saliva test kit from the web site at www.dadamo.com and follow the instructions. If you are type 2 diabetic, overweight and have had poor health all your life, with infections and allergies, then you may be a "Non-secretor", and need to eat accordingly from the Non-secretor list. If your health is fairly robust and "strong" then you are most likely a "Secretor", and this is the suitable list for you.

To maintain Acid/Alkaline ratios a 70% fruit and vegetable based diet daily should be attained.

If you want to recover from poor health, eat largely from the Highly Beneficial sections and supplement from the Neutral only.

The weakness for the B type is their Nervous system, and under stress they can end up with chronic fatigue and blood sugar problems. Nervous exhaustion is a real risk without balancing your activities.

The B is a strategist and seeks balance always in all things.

Strangely, B types handle dairy better than others, but realise that the quality of modern dairy with over 50 powerful growth hormones in it, is a real cancer risk. Goats milk and goats cheese are the exception, as Goat growth factor is different from cow, and cow is identical to human. Eggs are OK at 3 to 5 per week and if you eat fish then the fish list will be important to you.

There are 3 categories.

Highly beneficial - Excellent: is like a medicine

Neutral - OK: is neither good nor bad but will slow recovery if one is sick and eats too much from this category.

Avoid - NO: is harmful and will interfere with many body functions and prevent recovery.

The main risk foods are:

- Chicken, as it causes blood clotting in the B type
- Tomato, as it has the same effect
- Corn, Buckwheat and Rye as they affect insulin effectiveness
- Wheat and peanuts also.

The rule is to start the day with high water content foods such as fruit, and to make one's daily eating consist of 70% fruit and vegetables. Fresh fruit (3-5 varieties) and Yoghurt is an ideal breakfast for Type B, with a lunch and evening meal of protein and vegetables with rice.

Foods that encourage Weight Gain

Sweetcorn, lentils, peanuts, sesame seeds, buckwheat, wheat

Foods that encourage Weight Loss

Green vegetables, meat, eggs, liver, liquorice tea

Easy Reference Guide to Healthy Eating

Blood Type B, Secretor

Type	Excellent – Highly beneficial	OK - neutral	NO NO and NO Avoid
Meat	Lamb, Mutton, Rabbit, Venison	Beef (including minced), Liver (calf, chicken, pig), Pheasant, Turkey, Veal	Bacon, Chicken, Duck, Goose, Ham, Heart, Partridge, Pork, Quail
